S21066
Ig lambda chain V region - human
C;Species: Homo sapiens (man)
C;Date: 22-Nov-1993 #sequence_revision 17-Nov-1995 #text_change 21-Jan-2000
C;Accession: S21066
R;Dlouha, A.; Lecrotoisey, A; Henschen, A.; Ruttyn, Y.; Rouger, P.; Keil, B.
Protein Seq. Data Anal. 4, 319-134, 1991
A;Title: Partial amino acid sequence of the light chain of human anti-Rh(D) monoclonal ar A;Reference number: S21066; MUD:92253545; PMID:1812484
A;Accession: S21066
A;Status: preliminary
A;Accession: S21066
A;Residues: 1-213 - DLO>
A;Note: the sequence from Fig. 4 is inconsistent with that from Fig. 1 in having 74-Thr & C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin homology < IMM>
F;128-196/Domain: immunoglobulin homology < IMM>

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                    2561

Patent No. 6133426

GENERAL INFORMATION:
APPLICANT: Gonzalez, Tania R.
APPLICANT: Leong, Steven R.
APPLICANT: Leong, Steven R.
APPLICANT: Presta, Leonard G.
TITLE OF INVENTION: Antibody Fragment-Polymer Conjugates and
TITLE OF INVENTION: Humanized Anti-IL-8 Monoclonal Antibodies
NUMBER OF SEQUENCES: 72
CORRESPONDENCE ADDRESS:
                                              11;

SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/157,101A
FILING DATE: 05-APR-1994
CLASSIFICATION: 530
ATTORNEY/AGENT INPORMATION:
NAME: TITUG, MARLANA K
REGISTRATION NUMBER: 9437/204199
TELEPHONE: 202-861-371
TELEPHONE: 202-81-371
TELEPHONE: 202-81-371
TELEPHONE: 202-81-371
TELEPHONE: S02-81-371
TELEPAS: 6714627 CUCH
INFORMATION FOR SEQ ID NO: 7:
SEQUENCE CHARACTERISTICS:
LENGTH: 459 amino acids

Sequence 18, Application US/08887352B
Patent No. 5994511
GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of TITLE OF INVENTION: Improving Polypeptides
NUMBER OF SQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genentech, Inc.

Patent No. 5994511
GENERAL INFORMATION:
TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of
TITLE OF INVENTION: Improving Polypeptides
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genentech, Inc.
STREET: I DNA Way
CITY: South San Francisco
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             230
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    258 PPCPAPELLGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHN 317

Protein sequence of primatised form of the heavy chain of 7B6 antibody

```
This sequence represents a primatized form of the antibody 7B6 heavy chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple sclerosis, graft vs. Host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the Mab can be conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunosupens, can also be used as imaging agents and as vaccines or immunosupersessants. Aloky in the proteins or shulders long-term, antigen-specific immunosuppression, i.e. it inhibits production of interlukin-2. (T.), real proliferation and
New monoclonal antibodies specific for B7.1 or B7.2 antigens and inhibiting binding to CD28 - useful as specific immunosuppressants for treating diseases that involve interactions between T and B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               production of interleukin-2 (IL-2), T cell prolife
antigen-specific immunoglobulin G (IgG) responses
                                                                                            cells, e.g. graft rejection or tumours
                                                                                                                                                 Example 7; Fig 4b; 87pp; English.
```

478 AA; Sequence CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as

Example 8; Fig 4b; 89pp; English.

monoclonal antibody which specifically binds to B7.1 antigen

N-PSDB; AAS17245

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is concer where B calls promote the growth and/or metastasis of tumours, a cancer where B calls promote the growth and/or metastasis of tumours, B call lymphoma, B call lymphoma, B call lymphoma, a cancer where B calls promote the growth and/or metastasis of tumours, C cancer where mellitus, rheumatoid arthritis, psoriasis of tumours, cype I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammancy bile disease, allergy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive disease, intestinal inflammations and allergies e.g. migraine, disease and ulcerative collitis, food-related allergies e.g. migraine, sequence represents the havy chain of 786, a primatised antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

2 Polypeptides (AAW01819 and AAW01820) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 7B6. Cloned 7B6 light and heavy variable genes (see also AAT62511 and AAT13847) are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. Of the primatised antibody in e.g. CHO cells. Primatised 7C10 and 16C10 anti-B7.1 antibodies have also been produced (see also AAW01817-19 and AAW01821-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

                                                                                                                                                                                                                           Gaps
                                                      EBV-transformed cell lines and mouse-human heterohybridomas producing human MAbs specific for the gp120 V3 loop of HIV-1 MN isolate were obtained. MAb 447-52D was found to recognise the tetrapeptide motif GPGK, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the H chain V region was derived from 447-52D and to which a signal sequence and a H chain intronic sequence are appended, fused to a fragment coney. a short intronic segment of the human gamma 1 C region and the human gamma

antibody fragments covalently attached to one or more nonproteinaceous polymer molecules, where the apparent size of the conjugate is at least about 500 kpa. Conjugates of antibody fragments which bind the human interleukin (IL) 8 with a nonproteinaceous polymer can be used for treating inflammatory disorders e.g. acute lung injury, ischaemic reperfusion disorder, and autoimmune diseases. They can also be used for treating e.g. inflammatory skin diseases including psoriasis and atopic dermatitis, systemic scleroderma and sclerosis, and asthmatic diseases. The conjugates can also be used as reagents in an animal model system for in vivo study of the biological functions of the antigen recognised by the conjugate. The present sequence represents a recombinant immunoglobulin protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      317
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                377

The invention relates to an anti-interleukin-8 (IL-8) monoclonal antibody (MAb). The anti-IL-8 MAb comprises a sequence containing the CDRs (complementarity determining regions) of the humanized anti-IL-8 6G4.2.5V1N35A light chain; and amino acids 24-253 of the humanized anti-IL-8 6G4.2.5V1N35A heavy chain. The anti-IL-8 MAbs and fragments and be used in diagnosis, for affinity purification of IL-8 from recombinant cell culture or natural sources and for the treatment of inflammatory disorders e.g. adult respiratory distress syndrome. Nucleic acids encoding the anti-IL-8 MAb can be associated in a vector with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule encodes a polypeptide which is an anti-interleukin-8 monoclonal antibody or antibody fragment useful for the production of anti-interleukin-8 monoclonal antibodies or fragments

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the heavy chain protein of the monoclonal antibody from clone JA. The invention relates to an isolated human monoclonal rables vitus neutralising antibody (virucide) derived from cDNA clones encoding the antibody heavy and light chains expressed in heterologous expression systems and purified away from deleverious contaminancs. The invention provides a fused gene encoding a chimeric immunoglobulin light chain and a fused gene encoding a chimeric immunoglobulin heavy chain. The antibody of the invention is useful for

treating an individual exposed to a rabies virus by administering to the individual a therapeutically effective amount of the antibody, and preventing a spread of the rabies virus to the central nervous system (CNS). The antibody of the invention provides a safe and efficacious post-exposure prophylactic therapy for individuals exposed to a rabies virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; novel protein; Antianaemic; osteopathic; antiinflammatory; immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerebroprotective; antifungal; antivitral; antibacterial; antialergic; dermatological; hamostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder.

Expectation or their active domains. The polypeptides, polynuclectides and

antibodies raised against the polypeptides caused in a method of

treatment of a mammal and prevention of disorders caused by the aberrant

protein expression or activity. The polypeptides can be used as

CC molecular weight markers, food supplements, and in antibody production.

The polypeptides are used to identify compounds which bind to the

polypeptides. Polynucleotides of the invention are used as probes and

primers, for sequencing, for chromosome or gene mapping, in the

production of recombinant proteins, and in generating anti-sense DNA or

RNA and in gene therapy. Polypeptides of the invention can be used to

target drugs to a tumour, in assays to determine biological activity, to

crafget drugs to a tumour, in assays to determine biological activity, to

raise antibodies/elicit an immune response, to determine quantitative

protein levels, as tissue markers, and to isolate receptors or ligands.

CC raise for the proliferantial may also be useful in treating platelet

disorders, stem call disorders, reconstanting burns, promoting

CC ligament and/or nerve tissue, wound healing, treating burns, promoting

CC ontraceptive, treating osteoporosis and osteoarthritis, an anemia,

CL and polyment and autoimmunity, cancerthing from bacterial, viral or

Graft-versus-host diseases, nervoses, and infection.

CH and inflammatory diseases, eczema, allersy, asthma,

CC antiliammatory diseases, eczema, heamophilia, thrombosis,

The proliamman servose system disorders, and infection.
                                                                                                                                                                                                                                                                        Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MEFGLSWVFLVALLRGYQCQVQLVESGGGVVQPGRSLRLSCAASGFTFSNYGMHWVRQAP 60

New conjugates of antibody fragments - having covalently attached non-proteinaceous polymer molecules, particularly polyethylene glycol, for improving the residence time in the circulation.

Example P; Fig 48A-Z; 328pp; English

This polypeptide is encoded by vector plasmid p6G4V11N35A.choSD.9 (see AAV44956). It comprises a humanised 6G4V11N35A IgG containing complementarity determining regions of murine anti-interleukin-8 (IL-8) mnoclonal antibody [MAD) 6G5.2.5 (see AAW69301-04) in a human template. Humanised anti-IL-8 MADS (see AAW69301-04) are described for use in diagnostic applications and in the treatment of inflammancy disorders. The invention provides conjugates of an antibody fragment and a polymer, such as PEG, that have improved half-life, mean residence time, and/or clearance rate. The conjugates can be used for immune therapy of e.g. psoriasis, responses associated with inflammatory bowel disease (such as Conjugates and ulcerative collitis), ischemic reperfusion, adult respiratory distress syndrome, dermatitis, meningitis, and encephalitis, uveitis, autoimmune diseases such as rheumatoid

The antibody is useful to inhibit and reduce the formation of amyloid plaques or the effects of toxic soluble Abeta species in humans their fragments are used for the manufacture of a medicant. This includes the prolonged expression of recombinant sequences of them in human tissues for the treatment of clinical/per-clinical Alzheimer's disease, bown's syndrome or pre clinical cerebral amyloid angiopathy. Specifically, the antibody is used to sequester Abeta into plasma, brain or cerebrospinal fluid to prevent/reverse accumulation of the Abeta peptide within the brain thereby improving cognition. The present sequence is the heavy chain of a humanised monoclonal antibody, Hu266, based on the mouse antibody 266.
                                                                                                                                                                                                                                                                                                             Monoclonal antibody; Hu266; nootropic; neuroprotective; Abeta peptide;

                                                                                                                               The sequence is that of the reshaped CAMPATH-1 heavy chain antibody. Reshaped CD4 antibody can be used to induce tolerance against an antigen. It can also be used to alleviate autoimmune diseases such as rheumatoid arthritis, and to prevent graft rejection. Tolerance to a graft, e.g. an organ graft or a bone marrow transplantation can also be useful to alleviate allergies. Tolerance to alleview allergies Tolerance to allergens could also be achieved. See also AMR22754-R22763.

This amino acid sequence represents the heavy chain of humanised anti-CD23 (FCERII) monoclonal antibody Cl1, composed of a human framework (HSIGKVII) and the heavy chain complementarity determining regions (see AAY3257-59) of murine antibody Cl1. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on capable of binding to the CD23 type II molecule expressed on capable of binding to the CD23 type II molecule expressed on content on in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, cliabetes, uveitis, dermatitis, psoriasis, uritcaria, nephrotic syndrome, glomerulonephitis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergice asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         receptor specific antibodies useful for treating e.g. arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       eczema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type 1 diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and
inflammatory bowel disease; ulcerative colitis; Crohn's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Shearin J;

Novel isolated tumor-associated antigen mucin-1-specific binding member for diagnosing and treating cancer, comprises mucin-1 binding domain or its portion for binding to an epitope of the protein core of mucin-1

Claim 12; Page 106-108; 126pp; English

The invention relates to an isolated tumour-associated antigen mucin-1 (MUC-1)-specific binding member comprising an antigen binding domain

```
cc region having an antibody variable light (VL) or heavy (VH) region,

or a complementarity determining region (CDR) of VL or VH. MUCI-specific

CD binding member is useful for diagnosing cancer, preferably adenocarcinoma

CT he binding of MUCI-specific binding member to MUCI is detected by a

detection method selected from enzyme-linked immunosorbent assay,

CC magnetic resonance imagnay, solintillation counting, and X-ray film.

CMUCI-specific binding member is useful for treating cancer, preferably

adenocarcinoma, in an individual, where the cancer is present in tissue

CC the breast, ovary, lung, or bladder of the individual. MUCI-specific

CD binding member is useful for diagnosing and imaging MUCI-sepressing

cancer cells and tissues, for purifying or isolating non-glycosylated,

CC underglycosylated or cancer-associated forms of MUCI or MUCI epitope-

CC containing molecules, and for therapeutically or prophylactically

CT treating cancer. The present sequence is human recombinant immunoglobulin

CC (Ig) heavy chain region (variable VH and CH constant heavy chain).
                                                                                                                                                                                                                                                                                                                                                                                          ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              379
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              259
